

Startup Instructions

Step 1: Launch Computer in Ubuntu

Step 2: Open Console and scan the QR below, then press ENTER

Step 3: Still in the console, scan the QR below, then press ENTER

Scanning Instructions

Scanners operate as two separate batches (Batch 1 and Batch 2).

Batch 1 scanners: First four starting from the left

Batch 2 scanners: Last four starting from the left

Step 1: Begin loading seeds for one batch, keep the packets on top of their scanner once loaded to keep track of them.

Step 2: Scan first the scanner's QR then the packet's QR for each scan in a respective batch. Then press enter and begin to load the other batch while the current batch is scanning.

Ensure you are on the correct side of the terminal, Batch 1 uses the left side while Batch 2 uses the right side.

Step 3: When a batch is finished scanning, unload the old packets and begin from step 1.

General Information

- To access scanned images, open Files and then click SeedScans.
- Virtual Machines can only be launched once per startup, so please shutdown the computer once a scanning session is terminated.
- For questions: email jeffersonkline@gmail.com
- If the scanning mechanism is causing issues, you can use a more robust legacy version which can be accessed by scanning the QR below for Step 3 of the Startup instructions. This version uses only QR codes from the packet (No Qr from scanner), which must be scanned from left to right for each respective batch.

Debugging Instructions

Step 1: First attempt to power off/on the machine (not restarting), then proceed as normal.

Step 2: If some/all scanners still won't work at all, it is likely a wiring issue.

First Power Off/On the machine again. Open a new console window by right clicking the console icon and press "New Window"

Scan the QR below, then press ENTER

Next, scan the QR below and press ENTER. Instructions will guide you.
